Chapter 1

Introduction

Perplexity AI, Inc., or simply Perplexity, is an American privately held software company offering a web search engine that processes user queries and synthesizes responses. Perplexity products use large language models and incorporate real-time web search capabilities, providing responses based on current Internet content, citing sources used. Its real-time search engine (API service) is called Sonar and is based on Meta's Llama model. A free public version is available, while a paid Pro subscription offers access to more advanced language models and additional features. Perplexity AI, Inc., was founded in August 2022 by Aravind Srinivas, Denis Yarats, Johnny Ho, and Andy Konwinski. As of September 2025, the company was valued at US\$20 billion. Perplexity AI has faced legal scrutiny over allegations of copyright infringement, unauthorized use of content, and trademark issues from several major media organizations, including the BBC, Dow Jones, and The New York Times. According to separate analyses by Wired and, later, Cloudflare, Perplexity uses undisclosed web crawlers with spoofed user-agent strings to scrape the content of websites that prohibit or explicitly block web scraping.

Chapter 3

Career and Contributions

History

In August 2022, Perplexity AI, Inc., was founded by Aravind Srinivas, Denis Yarats, Johnny Ho, and Andy Konwinski, engineers with backgrounds in back-end systems, artificial intelligence (AI), and machine learning. It launched its main search engine on December 7, 2022, and has since released a Google Chrome extension and apps for iOS and Android. In February 2023, Perplexity reported two million unique visitors. By April 2024, Perplexity had raised \$165 million in funding, valuing the company at over \$1 billion. As of June 2025, Perplexity closed a \$500 million funding round, elevating its valuation to \$14 billion. Investors in Perplexity AI have included Jeff Bezos, Tobias Lütke, Nat Friedman, Nvidia, and Databricks. Additionally, Perplexity has received funding from 1789 Capital, a venture capital firm notable for its association with Donald Trump Jr. During Bloomberg's Tech Summit 2025, Srinivas shared that the company processed 780 million queries in May 2025, as it recorded more than 20% month-over-month growth, with around 30 million queries processed daily. In July 2024, Perplexity announced the launch of a new publishers' program to share advertising revenue with partners. On January 18, 2025, the day before the impending U.S. ban on the social media app TikTok, Perplexity submitted a proposal for a merger with TikTok US. On August 12, 2025, Perplexity made a bid to purchase Chrome from Google for \$34.5 billion. Perplexity stated that the sale could remedy antitrust litigation against Google, in which a judge was considering compelling the sale of Chrome. In December 2025, Cristiano Ronaldo took an undisclosed stake in Perplexity AI and entered a global brand partnership with the company. As of early 2026, Perplexity AI reached a valuation of \$21.21 billion following its Series E-6 funding round. In January 2026, the company entered into a three-year, \$750 million commitment with Microsoft Azure to secure GPU capacity. In February 2026, Perplexity transitioned to a subscription-first model by discontinuing its AI-integrated advertising strategy. Leadership stated the move was intended to preserve user trust in the "answer engine," prioritizing objective results over ad revenue.

Products and services

Search engine web portal

Perplexity's primary offering is an online information retrieval system (search engine) that uses large language models to generate responses to user queries by searching and summarizing web-based content. Perplexity offers a feature known as Perplexity Pages that generates structured summaries and report-like content from user queries by aggregating cited sources. Perplexity is available to web users without charge or registration, a freemium model.

Perplexity Pro

Perplexity Pro is a subscription tier, a more capable paid "enterprise" service, including stronger security and data protection and additional tools, including the ability to search uploaded documents alongside web content and access to a programmatic application programming interface (API). It allows the user to select between backend models such as GPT-5.4, Claude 4.6, and Gemini 3.1 Pro. The company has also developed its own models, Sonar (based on Llama 3.3) and R1 1776 (based on DeepSeek R1).

Internal Knowledge Search

Internal Knowledge Search enables Pro and Enterprise Pro users to browse web content and their internal documents simultaneously. Moreover, it allows users to upload and search through files in Excel, Word, PDF, and other common file formats. Enterprise Pro users can upload and index up to 500 files.

Search API

Perplexity's Search API provides AI developers with programmatic access to the company's search infrastructure. The September 2025 release includes a software development kit, an open-source evaluation framework called `search_evals`, and documentation detailing the API's design and optimization.

Shopping hub

Perplexity's Shopping Hub is an online shopping platform that provides AI-generated product recommendations and enables users to purchase products directly through Perplexity's interface. It was launched in November 2024 with backing by Amazon and Nvidia.

Finance

In October 2024, Perplexity AI introduced new finance-related features, including software that tracks stock prices and company earnings data in real time. The tool provides real-time stock quotes and price tracking, industry peer comparisons, and basic financial analysis tools. The platform sources its financial data from Financial Modeling Prep.

Assistant

In January 2025, Perplexity launched the Perplexity Assistant, an AI-powered tool designed to enhance its search engine's functionality. It can perform tasks across multiple apps, such as hailing a ride or searching for a song, and can maintain context across actions. The assistant is also multi-modal, meaning it can use a phone's camera to provide answers about the user's

surroundings or on-screen content. Perplexity has acknowledged that the assistant is still in development and may not always function as expected. For instance, certain features, such as summarizing unread emails or upcoming calendar events, require users to enable a workaround based on notifications.

Comet

In July 2025, Perplexity launched Comet, an AI browser based on Chromium. Initially, access to the browser was limited to users subscribed to the most expensive subscription tier. The browser was later released for free download in October 2025. A key feature is the integration of the Perplexity search engine, which can perform a variety of tasks such as generating article summaries, describing an image, conducting research about a topic, and composing emails.

Truth Social chatbot

Perplexity has been contracted to produce a chatbot for Donald Trump's social media platform Truth Social.

Leadership

Aravind Srinivas is the CEO and co-founder of Perplexity AI. He previously held research positions at OpenAI, Google DeepMind, and other AI research institutions focusing on machine learning and artificial intelligence. In a March 2026 All-In episode, Srinivas said the incoming AI-related layoffs were "glorious future" to "look forward", as it freed people from jobs they didn't like and gave them opportunities to pursue entrepreneurship.

Controversies

Copyright and trademark infringement allegations

In June 2024, Forbes publicly criticized Perplexity for using their content. According to Forbes, Perplexity published a story largely copied from a proprietary Forbes article without mentioning or prominently citing Forbes. In response, Srinivas said that the feature had some "rough edges" and accepted feedback but maintained that Perplexity only "aggregates" rather than plagiarizes information. In October 2024, The New York Times sent a cease-and-desist notice to Perplexity demanding that it stop accessing and using NYT content, claiming that Perplexity is violating its copyright by scraping data from its website. In June 2024, Dow Jones and New York Post filed a lawsuit against Perplexity, alleging copyright infringement. The lawsuit also alleged that Perplexity harmed their brand by attributing hallucinated quotes, for example, on F-16 jets for Ukraine, to articles that did not include them. On October 24, 2024, Perplexity AI published an official response on its company blog asserting that the claims in the lawsuits were misleading and stating it was open to revenue-sharing arrangements with content providers. On January 31,

2025, Perplexity was sued in the United States for alleged trademark infringement by Perplexity Solved Solutions (PSS), a software firm founded in 2017. The lawsuit claims that Perplexity AI's use of the name "Perplexity" violates PSS's federally registered trademark and could cause consumer confusion. PSS had previously declined an offer from Perplexity AI to purchase the trademark in 2023. The suit seeks to prevent Perplexity AI from using the name in its branding and marketing. In June 2025, UK broadcaster the BBC threatened legal action against Perplexity AI, demanding that the company stop the unauthorized scraping of its content, delete all retained BBC material used in training its models, and provide financial compensation for the infringement of its intellectual property rights. On August 8, 2025, the Japanese newspaper company Yomiuri Shimbun filed a lawsuit against Perplexity for "free-riding" use of 120,000 articles of the publication from February to June 2025. Later that month, two more Japanese newspaper companies, The Asahi Shimbun and The Nikkei, also sued the company for alleged copyright infringement. In October 2025, Reddit sued Perplexity in federal court in New York, alleging that it and three other companies unlawfully scraped its data.

Stealth web crawlers

In June 2024, separate investigations by the magazine Wired and web developer Robb Knight found that Perplexity does not respect the Robot Exclusion Protocol (or robots.txt) standard, which may include requests for web crawlers to not scrape sections of the site's content, despite Perplexity claiming the opposite. While Perplexity publicly lists the IP address ranges and user agent strings of its web crawlers, Wired and Robb Knight claim that it uses undisclosed IP addresses and spoofed user agent strings when ignoring robots.txt. In response, Srinivas stated that Perplexity was not ignoring robots.txt, but suggested that it relied on third-party web crawlers that do. When asked, Srinivas declined to commit to cease scraping Wired content using third parties. In August 2025, Cloudflare published research revealing that Perplexity was using undeclared "stealth" web crawlers to bypass web application firewalls intended to block Perplexity crawlers, and did not respect robots.txt files. Among others, Cloudflare's CEO Matthew Prince tweeted that Perplexity acts "more like North Korean hackers" than a reputable AI company. Perplexity publicly denied the claims, labeling them as a "charlatan publicity stunt."

The AI race is shifting from bigger models to cheaper, smarter systems - CNBC

CNBC | 2026-07-10

For the past two years, the artificial intelligence race has been easy to score: bigger models, better benchmarks and whichever company could claim the lead, at least until the next launch. As companies move from testing AI to using it in real products and workflows, it's not longer about tapping the best model, but accessing the one that's the best fit for a specific job, at the right cost, with the necessary data and in a chosen environment. That shift is opening the door for a new kind of AI competition, one focused less on model size and more on routing, cost, control and compute. "The model alone is no longer the product," Perplexity CEO Aravind Srinivas told CNBC. "It is the harness, the orchestration system that puts the model inside a very capable harness and pairs the model with a lot of tools." That means AI products are becoming systems that can decide which model to use, when to use it and what outside tools or company data sources are necessary. A customer service task might not need the most expensive model. A complex coding problem might. A routine internal workflow could run on a cheaper open model. A harder step could be escalated to a more powerful one. "The answer is always use whatever is the best for the task," Srinivas said. The emergence of alternative models comes as corporate America tightens its belt on AI spending, and presents another challenge for OpenAI and Anthropic, which have flourished over the past few years by selling the most cutting-edge technology. Perplexity this week previewed a new system for its computer-use product built around GLM 5.2, an open model from China's Z.ai. The system is designed to let a cheaper model

handle more of the work while calling in a stronger model only when needed. That approach reflects a broader change in the market. Open-weight models, which can be downloaded, tuned and run by companies themselves, are becoming more capable. They are also cheaper to run than premium proprietary models from the biggest AI labs. Benchmark general partner Peter Fenton said the shift could be dramatic. "A maybe contrarian view that is becoming consensus is our belief that 90-plus percent of the tokens created will come out of open-weight models over the next 18 to 24 months, possibly even by the end of the year," Fenton told CNBC. "The inference margins generated by the frontier model companies, I think, are going to come under pressure when you can run those without the markup that they're providing, when you have good enough models from open weights," Fenton said. Fenton said the move to open models is not only about saving money. In some cases, smaller models that are tuned for a specific task can be faster and perform better than larger general-purpose models. That is one reason Benchmark invested in Ollama, a company that makes it easier for developers and enterprises to download, run and manage open models. "One thing is where the model's from and where it was created and trained," Ollama CEO Jeff Morgan said. "But the more important thing to these businesses we speak to is where it runs and how it runs." Morgan said Ollama has been adopted by more than 85% of the Fortune 500, including companies in regulated industries such as aviation, insurance and health care. He said many companies start with smaller models running close to their own data, then expand to larger open models as they get more comfortable. The rise of open models also creates a strategic challenge for the U.S. Many of the most competitive open-weight models are coming from Chinese labs, including Z.ai and DeepSeek . That has made open-source AI a business issue, a policy issue and a national competitiveness issue. Srinivas said the U.S. should support open models because they make AI more affordable and accessible. "If you want the benefits of AI to be widely distributed to small businesses in America and American allied countries, then you really need AI to be a lot more affordable," Srinivas said. "And open source is the only way to do that." The shift could also affect the massive data center buildout underway across the tech industry. The current AI boom assumes demand will keep flowing to large cloud data centers filled with high-end chips. Srinivas says some AI work may eventually run locally instead, on devices owned by consumers or businesses. That wouldn't eliminate the need for data centers, but it could create a more hybrid AI system, with routine tasks run locally and the most difficult work getting sent to a more powerful model in the cloud. For investors, the question is whether the biggest AI labs can maintain their pricing power as open models get better and companies become more selective about what they use. WATCH: OpenAI's Sam Altman says Chinese open source models are getting very good

Perplexity CEO's secret to success is 'sleeping with that fear' your competitor will steal your idea - Fortune

Being a startup founder today means operating with a constant sense of urgency. The clock is always ticking—investors want returns, rivals are circling, and someone else could be racing to market with your idea. But rather than letting that pressure paralyze him, Aravind Srinivas, the cofounder and CEO of AI search startup Perplexity—which was reportedly last valued at \$20 billion—uses it as fuel. “You should assume that if you have a big hit, if your company is something that can make revenue on the scale of hundreds of millions of dollars or potentially billions of dollars, you should always assume that a model company will copy it,” Srinivas said last year at Y Combinator’s AI Startup School. “You’ve got to live with that fear and you have to embrace it. Realize that your mode comes from moving fast and building your own identity around what you’re doing because users at the end care.” For the 32-year-old, embracing that pressure has helped him build out a multi-billion-dollar AI-powered search engine that rivals the innovation of tech giants Google and Microsoft, as well as fellow newcomers OpenAI and Anthropic. Perplexity’s success has even caught the eye of Apple, last year reportedly had talks about purchasing Perplexity. For Srinivas, staying ahead of the competition admittedly means frequently sacrificing work–life balance. “I don’t do anything other than working, sadly. I listen to podcasts and audiobooks whenever I can. I spend a lot of time on X (which is both good and bad),” Srinivas said in a Reddit Ask Me Anything (AMA) in 2025. While he still makes time to spend time with family on the weekends—and even hit the gym three times a week—he emphasized that persistence matters: “Work incredibly hard. There is no substitute for it,” he said to the Y Combinator crowd. “There’s real benefit from embracing that fear and sleeping with that fear and waking up every day and feeling excited about what you’re doing to build because that’s the only thing that’ll keep you going.” Luckily (or not) for Srinivas, he’s about to get more motivation as the competition gets thicker: AI has ushered in an era where building out a business is easier than ever. After all, generative technology can help create business plans in just a matter of seconds. OpenAI founder and CEO Sam Altman believes this will lead to entrepreneurship growing exponentially. “In my little group chat with my tech CEO friends, there’s this betting pool for the first year that there is a one-person billion-dollar company,” Altman told Reddit cofounder Alexis Ohanian in a 2024 interview. “Which would have been unimaginable without AI, and now will happen.” And while that dream of a one-person, billion-dollar company has yet to come to fruition, other tech leaders have conceded it’s bound to happen eventually—and have even raised the ceiling. Billionaire Mark Cuban predicted last AI will eventually help crown the world’s first trillionaire (although Elon Musk claimed that title on Friday following SpaceX’s record IPO). “We haven’t seen the best or the craziest of what [AI is] going to be able to do,” Cuban told the High Performance podcast in an episode published last year. “And not only do I think it’ll create a trillionaire, but it could be just one dude in the basement. That’s how crazy it could be.” A version of this story originally published on Fortune.com on July 16, 2025.

Perplexity CEO Aravind Srinivas on the one thing that sets US apart: ‘It's why America is still at the top’ | Hindustan Times -

For Aravind Srinivas, the defining feature of the United States is not just its thriving startup ecosystem or access to capital — it is a culture that encourages people to pursue bold ideas. Speaking on The Joe Rogan Experience, the Perplexity CEO reflected on what he believes sets America apart from other countries, saying the US continues to reward risk-taking and independent thinking. Aravind Srinivas is a 2017 IIT Madras graduate who moved to the US to pursue higher education before launching Perplexity. Launched in 2022, the startup was valued at \$20 billion in September 2025. On the podcast, host Joe Rogan asked him about his idea of the American dream. "What did the American dream sound like to you when you weren't in America? Like, how was it discussed?" Rogan asked. "I always thought America is the only country where you can come here and have an idea, and people listen to you and encourage you to go pursue it. The risk-seeking culture is just incredible here," 32-year-old Srinivas answered. He contrasted this with what he described as a greater tendency in other countries to defer to authority. "Everybody everywhere else, you kind of are either explicitly or implicitly forced to defer to authority. Sure, you can consult everybody out there, but if you have a thought that challenges what they believe, this country still encourages you to go pursue it," he said. Srinivas, who was raised in India before moving to the US to study at University of California, Berkeley, said America offers aspiring entrepreneurs the opportunity to take on even the world's largest companies. "When I came here, obviously Google was the number one company that everybody wanted to work in, but it's also the same country where it allows you, as a new person, to start a new idea that challenges one of the biggest companies in this own country," he said. Recalling his academic experience, Srinivas said people were willing to offer honest feedback without discouraging unconventional ideas. "People actually give you very honest feedback about things, but they don't stop you from working on anything. That's fantastic because that's very fresh, it's very liberating," he said. When podcast host Joe Rogan asked whether the same environment existed elsewhere, including India, Srinivas said it would be an oversimplification to say it did not exist outside the US, but argued it was less prevalent. "It's a simplification to say it's not anywhere else, but it's not as encouraged. The incentive structures are not quite there, and the ability to be taken seriously for some crazy ideas is why America is still at the top," he said. (Also read: Arvind Jain, IITian founder of \$7.2 billion company, says US still beats the world for entrepreneurs) Sanya Jain is an Assistant Editor with Hindustan Times Digital. She has nearly a decade of experience in covering offbeat stories that speak to the everyday experience - from viral videos to human interest copies that spark conversation. Her interests stretch across business, pop culture, social media trends, entertainment and global affairs. Before joining Hindustan Times, Sanya spent two years with Moneycontrol and five years with NDTV. She holds an undergraduate degree in English literature from St Stephen's College, Delhi, and a master's in journalism from the Xavier Institute of Communications, Mumbai. Sanya has a sharp eye for spotting emerging trends and looking for newsworthy angles to elevate viral posts into meaningful narratives. She was the first one, for

example, to cover Narayana Murthy's remark on 70-hour work weeks that sparked a national conversation. She is equally at ease writing about business leaders as about the common man, about issues of national importance and memes that amuse social media. Sanya enjoys speaking with content creators, newsmakers and entrepreneurs to transform everyday moments into engaging, slice-of-life stories that resonate with readers. When she is not working, Sanya can be found curled up with a good book. Born and raised in Lucknow, she has spent the last several years in Delhi. She is deeply interested in animal welfare and now spends a lot of her time running after her destructive orange cat. [Read More](#)

Why Perplexity's Founder Doesn't Think the American Dream Is Over - Business Insider

Perplexity, Sky and McDonald's: This Week's Top Five Stories - Business Chief

Business Chief | 2026-07-11

Aravind Srinivas, CEO of Perplexity, says the US is still the most effective region for startups as it encourages people to pursue ambitious goals and offers a strong access to capital. Discussing the country's prospects on The Joe Rogan Experience, Aravind expressed his beliefs on why the US is distinct from other countries, citing how entrepreneurs are incentivised to take risks and think independently. "I always thought America's the only country where you can come here and have an idea, and people listen to you and encourage you to go pursue it," Aravind said. "The risk-seeking culture is just incredible." Jamie Dimon, CEO of JPMorgan and Chase has criticised Canadian Prime Minister Mark Carney's efforts to establish a middle powers coalition to counter larger global superpowers. Speaking at the Council on Foreign Relations's CEO Speaker Series, Jamie called Carney's call to action for governments to work together "a fantasy". Mark first discussed the idea of a greater global coalition at The World Economic Forum earlier this year, saying that countries needed to strengthen their cooperations on trade, AI, supply chains and security. However, Jamie argues that Europe has attempted a similar, unsuccessful approach. "They did that. It's called Europe," Jamie said, suggesting that Europe is currently experiencing a decline in business and competitiveness. Aligning with Jamie's statement, research from World Bank Group shows that in 2024, the European Union generated approximately US\$19.5tn in GDP, compared to the US's GDP of US\$28.8tn. Comcast-owned Sky has agreed to acquire ITV's broadcast channels and streaming service for £1.6bn (US\$2.13bn), a transaction that could reshape the competitive landscape for British broadcasters facing mounting pressure from global streaming platforms. The deal was announced this week and represents a consolidation strategy

among domestic networks seeking to protect advertising revenue and market share as traditional television audiences migrate to on-demand services. According to market data, ITV shares rose 1.2% to £0.83 (US\$1.11) following the announcement. Dana Strong, Chief Executive Officer of Sky, described the acquisition as a "defining moment" in British broadcasting history, while the takeover brings together the UK's largest free-to-air commercial broadcaster with a major pay-TV operator in response to the structural challenges posed by streaming competitors. McDonald's operates more than 43,000 restaurants worldwide. This scale makes the company one of the most influential buyers in the beef supply chain. The fast food chain announced in 2014 it would pursue sustainable beef sourcing and has since regionalised its supply networks. All US burgers now come from North American beef and UK restaurants source from Northern Ireland. The company helped found the Global Roundtable for Sustainable Beef and its European arm. It maintains involvement in sustainability discussions across the industry. Political leaders like French President Emmanuel Macron and Indian Prime Minister Narendra Modi have sought to meet with some of the world's leading tech CEOs to secure investment and large infrastructure projects. Macron previously hosted AI firm leaders at the G7 summit last month and personally asked SoftBank CEO Masayoshi Son to invest billions of dollars into France's AI data centre strategy. Additionally, Prime Minister Modi met Amazon CEO Andy Jassy last week, thanking the retail leader for his record US\$48bn investment into India, of which US\$21bn will go towards the country's AI and cloud infrastructure. Modi also met with several other tech leaders in the previous year, such as Microsoft CEO Satya Nadella, Google CEO Sundar Pichai and Intel CEO Lip-Bu Tan to discuss similar AI investment plans for India's economy.

Perplexity's CEO Predicts Micron Could Overtake Meta In Stunning AI Power Shift: 'Whatever Is The Bottleneck Will...' - Yahoo Finance

Yahoo Finance | 2026-06-18

Benzinga and Yahoo Finance LLC may earn commission or revenue on some items through the links below. Perplexity AI co-founder and CEO Aravind Srinivas has predicted that semiconductor giant Micron Technology Inc. could soon surpass Meta Platforms Inc. in market capitalization. Srinivas argues that global tech dominance is shifting entirely toward hardware providers,

explaining that severe physical supply chain constraints have become the primary factor determining Wall Street's biggest artificial intelligence winners. Speaking in a recent podcast with Harry Stebbings, Srinivas explained that software platforms and AI models are facing rapid commoditization, shifting true economic leverage back to physical infrastructure. A single bad hire can set a startup back years. Here are the 5 hires founders most often misjudge — and why Still Learning the Market? These 50 Must-Know Terms Can Help You Catch Up Fast The massive rise of autonomous AI agents has triggered an insatiable demand for high-performance memory (HPM) and enterprise processors, causing hardware supply chains to tighten globally. "Whatever is the bottleneck will command the price," Srinivas asserted, dismissing assertions that memory and infrastructure stocks have already peaked. He noted that hardware suppliers hold absolute pricing power because market demand vastly outstrips global manufacturing capacity. \$MU at \$1 trillion market cap. Meta at \$1.3-1.4 trillion. @AravSrinivas says Micron closes that gap in 6-12 months if HBM stays the binding constraint. On @twentyminutevc : every inference run needs HBM memory. That has pushed HBM costs up 5x in cost of goods. The entity that... pic.twitter.com/t9X3kweOxX Trending: Avoid the #1 Investing Mistake: How Your 'Safe' Holdings Could Be Costing You Big Time This ongoing hardware deficit is poised to disrupt the traditional hierarchy of trillion-dollar tech giants. Srinivas pointed out that Micron is rapidly closing the valuation gap with major software and social media platforms, a trajectory driven by critical shortages that have already seen certain component costs surge fivefold. "It might not be inconceivable that Micron, the supplier of HPMS, might be more valuable than Meta in the next 6 to 12 months," Srinivas stated. While consumer platforms face heavy capital expenditure costs to maintain engagement, memory manufacturers directly control the essential components required to keep the global AI ecosystem running. According to the CEO, long-term market value belongs exclusively to companies that solve the physical friction of AI scale. As public resistance and power grid limitations slow down data center buildouts, physical hardware layers will remain structural choke points. Consequently, institutional investors are expected to steadily reallocate capital away from traditional software providers to fund the hardware anchoring the AI boom. See Also: Skip the Regrets: The Essential Retirement Tips Experts Wish Everyone Knew Earlier. Shares of MU have surged by 257.65% year-to-date. It closed 6.18% lower at \$1,020.76 apiece on Tuesday, and it was up 3.50% in premarket on Wednesday. Over the last month, MU stock was up 40.86%, and it fell 339.02% over the last six months; the stock was 751.77% higher over the year. Benzinga's Edge Stock Rankings indicate that MU maintains a strong price trend in the long, medium, and short terms, with a poor value score. Read Next: Think you're saving enough for your kids? You might be dangerously off — see why Building a resilient portfolio means thinking beyond a single asset or market trend. Economic cycles shift, sectors rise and fall, and no one investment performs well in every environment. That's why many investors look to diversify with platforms that provide access to real estate, fixed-income opportunities, precious metals, and even self-directed retirement accounts. By spreading exposure across multiple asset classes, it becomes easier to manage risk, capture steady returns, and create long-term wealth that isn't tied to the fortunes of just one company or industry. Backed by Jeff Bezos, Arrived Homes makes real

estate investing accessible with a low barrier to entry. Investors can buy fractional shares of single-family rentals and vacation homes starting with as little as \$100 . This allows everyday investors to diversify into real estate, collect rental income, and build long-term wealth without needing to manage properties directly. Residential real estate has historically provided investors with income potential and long-term appreciation, but direct ownership can be expensive and time-consuming. ARK7 enables investors to buy fractional shares of rental properties, offering access to potential rental income and real estate exposure without property management responsibilities. By lowering the barrier to entry, the platform gives investors another way to diversify beyond traditional stocks and bonds. Electric aviation is an emerging industry with the potential to transform personal transportation and urban mobility. Droni is developing eVTOL aircraft designed for personal use, aiming to combine the convenience of a car with the flexibility of vertical flight. As interest in advanced air mobility grows worldwide, the company is positioning itself within a sector that could play a significant role in the future of transportation. Immersed is building technology for the future of work through spatial computing . Known for its AR/VR productivity platform that enables users to work across multiple virtual screens, the company has grown to more than 1.5 million users worldwide. Immersed is also developing Visor, a lightweight headset designed specifically for professional productivity, positioning the company at the intersection of remote work, extended reality (XR), and next-generation computing. Fine wine and rare whiskey have historically moved independently of the stock market, making them a compelling alternative asset. Vinovest manages authenticated, insured portfolios of investment-grade wine and whiskey starting at \$5,000 — sourcing, storage, and insurance all handled for you. EnergyX is a clean energy technology company focused on direct lithium extraction and refinery technologies for the lithium-ion battery supply chain. Its proprietary DLE systems are designed to recover lithium from brine resources more efficiently and with less environmental impact, supporting efforts to expand lithium supply for electric vehicles, grid-scale storage, and other battery applications. Farmland has historically held its value through market volatility and delivered returns uncorrelated to stocks and bonds. For accredited investors, FarmTogether offers direct access to high-quality U.S. farmland starting at \$15,000 — fully managed, with no landlord headaches. For accredited investors looking beyond stocks and bonds, EquityMultiple provides access to vetted commercial real estate deals starting at \$5,000 , with only ~5% of opportunities passing their due diligence process. Private real estate and private credit can add income and stability to a stock-heavy portfolio. Fundrise offers access to diversified private real estate and credit strategies through an easy-to-use platform, with professionally managed portfolios designed to generate passive income and long-term growth. American Hartford Gold is a precious metals dealer that helps clients buy physical gold and silver coins and bars, either for direct delivery or within self-directed precious metals IRAs. The company's services include gold and silver IRAs, IRA rollovers, and home delivery of bullion, giving investors a way to use tangible metals to diversify portfolios and seek protection against inflation and market volatility. Mode Mobile is changing the way people interact with their phones by letting users earn money from the same apps and activities they already use every day. Instead of

platforms keeping all the advertising revenue, Mode Mobile shares a portion back with users who engage with content, play games, and scroll on their devices. Named one of Deloitte's fastest-growing software companies in North America, the company has built a large beta user base and is scaling a model that turns everyday smartphone usage into a potential income stream.

Join Greg Brockman, Aravind Srinivas, Aaron Levie, and More at Big Technology's AI Summit - Big Technology | Alex Kantrowitz

Big Technology | Alex Kantrowitz | 2026-05-06

I'm thrilled to announce the first ever Big Technology AI Summit , taking place in San Francisco on June 18, 2026. It'll be a day of high-profile, news-making interviews with the top leaders in AI at The Commonwealth Club, followed by a wine reception on the roof. We're going to have a top-tier set of guests on stage with me for a packed day ...

Tech CEO Aravind Srinivas slammed after saying AI layoffs are fine because people hate their jobs, anyway - New York Post

New York Post | 2026-03-31

Perplexity AI CEO Aravind Srinivas is coming under fire for arguing people should embrace being replaced by artificial intelligence since they don't like their jobs, anyway. The co-founder of the San Francisco-based company even said on the All-In podcast that the jarring shift in how work gets done will lead to a "glorious future" everyone should be happy about. "The reality is most people don't enjoy their jobs," the exec said on the episode published Monday. "There's suddenly a new possibility, a new opportunity, to use these tools, learn them, and start your own mini business," he opined. "Even if there is temporary job displacement to deal with, that sort of glorious future is what we should look forward to." Listeners were quick to turn to voice outrage, with some saying Srinivas was out of touch with everyday people who are struggling to make ends meet after getting laid off. "A man worth millions just told the single mother who lost her job that she should be grateful because now she can start a business using his product and called her unemployment a glorious future," one commenter wrote on X. "This is what happens when you've never needed a paycheck to keep the lights on." Asked for comment Tuesday, a Perplexity spokesperson told The Post: "Since Perplexity launched in December 2022, Americans have filed 16 million new business applications, contributing to the reversal of a 40-year decline and proving yet again that breakthrough technologies don't eliminate opportunity, they create it." Recent months have seen a number of large companies announce brutal layoffs — with some firms, like

Amazon and Block , blaming AI for at least part of the trend. "His view treats job loss as a temporary shock that opens a path toward one-person or very small firms that produce real revenue without the payroll that older companies needed," one commenter wrote. "But the problem with this scenario is that losing a stable paycheck is painful for most, and many workers cannot instantly become founders. Economists still disagree on whether AI is replacing labor at large scale or merely giving companies a new excuse for cuts." "He is kinda right though," a user wrote. "A few years ago, one person couldn't realistically run ops, marketing, support, and product all alone, but now they can – and some of them are making real numbers." Another added: "This shift could indeed democratize entrepreneurship by lowering business creation costs." Goldman Sachs economists said in February that AI was responsible for up to 10,000 monthly net job losses last year in some domestic industries. Executive coaching firm Challenger, Gray & Christmas said AI caused 11,039 job cuts in February in the tech sector for a total of 33,330 in 2026. That's an increase of 51% from the 22,042 tech job cuts during the same period last year.
